INTRODUCTION

ABSTRACT

- The Complaint Management System is a web-based application developed using PHP and MySQL to efficiently manage and resolve customer complaints in an organized manner.

- The system provides a user-friendly interface where users can register, log in, and submit their complaints regarding products or services.

- Each complaint is stored in a centralized database, allowing administrators to track, update, and resolve issues systematically. The system includes different modules such as Admin and User. Users can view the status of their complaints, receive updates, and provide feedback.

- Administrators have the authority to categorize complaints, assign them to relevant departments, update statuses, and generate reports for analysis.

PROJECT MODULES

In **Complaint Management System** we use PHP and MySQL Database has following modules:

- ✓ **Admin**
- ✓ **User**

ADMIN MODULE

- Admin can create a category and also manage the category
- Admin can create Subcategory and also manage the Subcategory
- Admin can create state and also manage the state
- Complaint Management Admin can update remark on complaints
- Manage users
- Admin can check user logs
- Admin change password

USER MODULE

- User Registration
- User forgot Password
- After login user can lodge a complaint
- Complaint History
- Profile Management
- Change Password
- Dashboard

PROPOSED SYSTEM

The proposed system is a web-based Complaint Management System developed using PHP and MySQL that automates the process of registering, tracking, and resolving customer complaints. Users can submit complaints online, and administrators can manage, monitor, and resolve them through a centralized platform. The system provides real-time status updates and maintains a structured database of all complaints.

Advantages:

- Reduces manual work and paperwork.
- Provides quick and easy complaint registration.
- Enables efficient tracking and management of complaints.
- Improves transparency with real-time status updates.
- Ensures secure storage of complaint data.
- Enhances communication between users and administrators.
- Saves time and increases overall efficiency.
- Improves customer satisfaction through faster resolution.

EXISTING SYSTEM

- The existing system for handling complaints is mostly manual or semi-digital. Complaints are usually recorded through phone calls, emails, or written forms, which makes the process time-consuming and less organized. There is no centralized system to store and manage complaint data efficiently.
- Tracking the status of complaints is difficult, and users often do not receive timely updates. This leads to delays in resolving issues and poor communication between customers and the organization. Additionally, maintaining records manually increases the chances of errors, data loss, and duplication.
- Overall, the existing system lacks efficiency, transparency, and proper management, highlighting the need for an automated Complaint Management System.

HARDWARE & SOFTWARE REQUIREMENTS

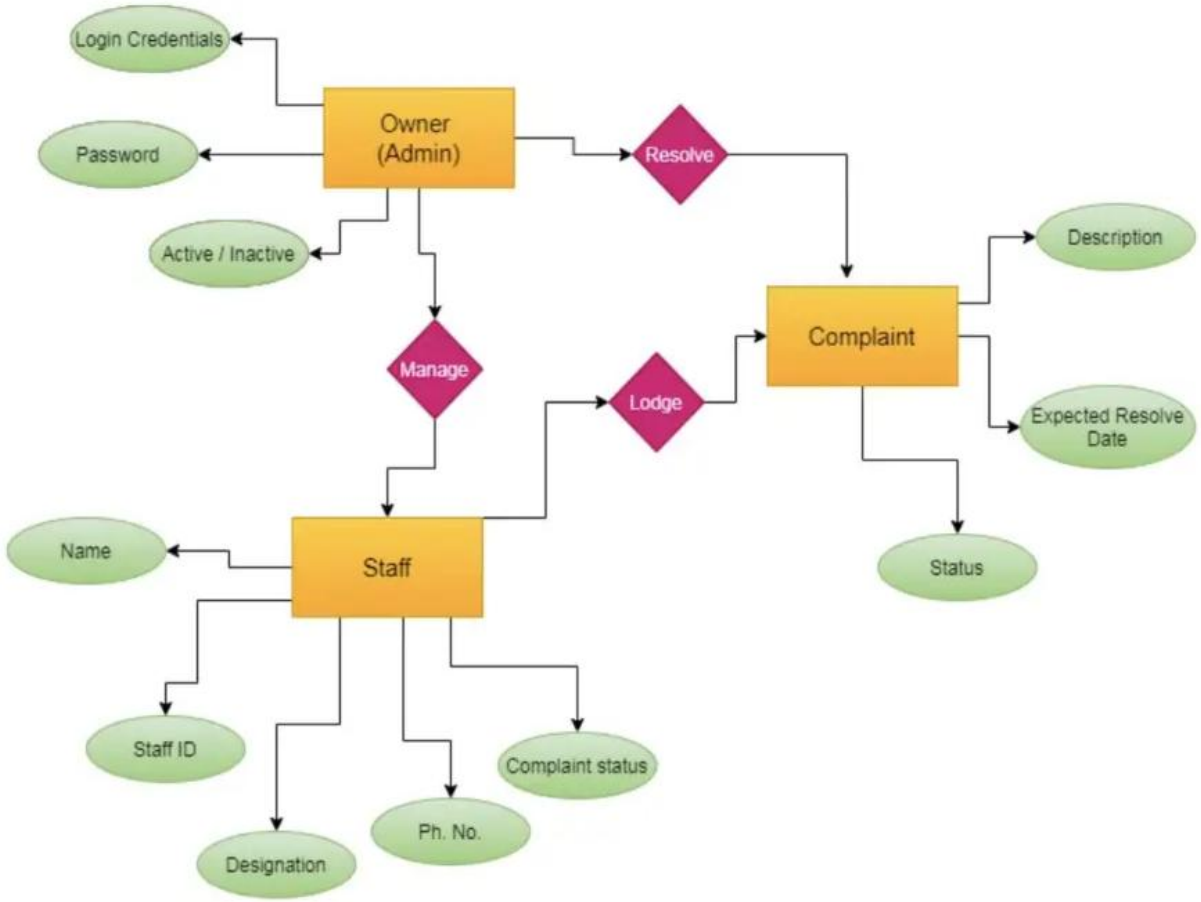
SOFTWARE REQUIREMENTS

- Platform : HTML5, PHP3
- Database : My-SQL 5.6.8
- Software : XAMPP, Dream-viewer 8
- Media Package : J-Query, JavaScript
- Protocol : FTP, HTTPS

HARDWARE REQUIREMENTS

- Processor - Pentium IV
- Hard disk - 80GB Hard disk
- RAM - 1GB RAM
- OS - Windows XP/7/8.1/10/11
- Internet Usage - 1.2 Mbps

FLOW DIAGRAM



FEATURES OF THE PROJECT

A Complaint Management System is designed to simplify the process of registering, tracking, and resolving user complaints efficiently. It allows users to submit complaints through a simple interface, where each complaint is assigned a unique ID for easy tracking.

The system categorizes complaints and forwards them to the appropriate department or staff for quick action.

Administrators can monitor all complaints through a dashboard, update their status (such as pending, in progress, or resolved), and ensure timely resolution. Users receive updates about their complaint status and can provide feedback after the issue is resolved.

The system also includes features like search and filtering, report generation, and secure data management. Overall, it improves communication, increases transparency, and enhances service quality by ensuring that complaints are handled in an organized and timely manner.

CONCLUSION

- The Complaint Management System developed using PHP and MySQL provides an efficient and reliable solution for handling customer complaints. The system simplifies the process of complaint registration, tracking, and resolution through an easy-to-use web interface.
- By automating the entire complaint handling process, the system reduces manual work, minimizes errors, and improves response time. It ensures transparency by allowing users to monitor the status of their complaints and receive timely updates. The centralized database helps in maintaining accurate records for future reference and analysis.
- Overall, the system enhances communication between users and administrators, improves operational efficiency, and increases customer satisfaction. The project successfully demonstrates how technology can be used to streamline complaint management processes in an organized and effective manner.
